

Snappy marking!

Brand new: the needle without a point!

TICOM® FineMarker

The first TICOM marker with a hard metal microneedle, specially developed for use in toolmaking, mechanical engineering and the production of jigs and fixtures. The circular cutting edge of this superfine needle cuts a particularly clear outline in the metal. When it is worn down, simply snap it off and push out a new length of needle instead of grinding. Or briefly sharpen the needle with a silicon carbide whetstone. That eliminates the cost-intensive journey to a grinder. Simply press the soft-push mechanism and the needle head slides back into the protective shaft.

A simple snap

The blunt TICOM hard metal microneedle need not be reground: instead, the tip is extended by approx. 2 mm, snapped off and work can continue immediately. The needle has a useful length of no less than 25 mm.

Or sharpen

It is even more economical to sharpen the end of the needle on a whetstone until plane.

Extremely accurate

TICOM microneedle: The new art of marking: its circular cutting edge shaves a groove in the metal, making all outlines particularly distinct.

Fine and strong

With a diameter of 0.38 mm, the TICOM microneedle may be a dwarf - but its strength lies in the distinct outlines which it produces. Made of hard metal. Available in refill packs.

High-speed loading

Remove the button, fill in the TICOM microneedles and refit the button.

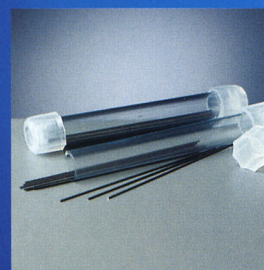

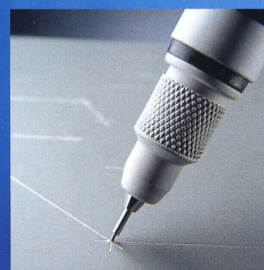

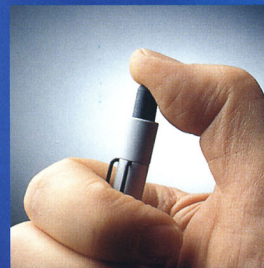

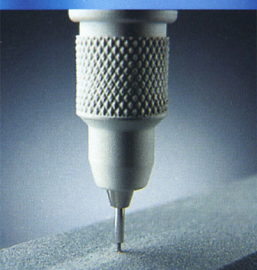

Lightly press the button and the mechanism advances from the shaft.

Press the button down completely twice and the tip of the needle is ready for use.

Well protected

TICOM Soft-Push. The needle head disappears in its protective shaft when the button on the clip is pressed.
